

App Development Project 3

PHASE 1:

User Profiles

- A streamer queues up a song list they've input so any guests they have on are listening to the same things the streamer is. (make the use of the bot easy)
- A friend group is passing around music they like, so the bot can be reaccessed easily to change who is in control of it.

Discord Music streaming bot

MUST HAVE FEATURES

- Use key to authorize people to use the bot in one session
- backend authentication of links, methods
- 3rd party api calls through discord
- server rendering for key verification
- http requests to connect, play, disconnect
- music data modeled to send to backend

STYLE GUIDE:

- attempt to use discord's style guide
(<https://my.corebook.io/1zObrQ89Q4wHhgFCfYIUhMUvmNf4XjxO/01-overview/welcome>) to allow consistent coloring with the system we're integrating with

VIEWS:

- one to block access to further systems until id is verified
- one to allow submitting of songs
- see queue?

TOOLS BEING USED AT THE MOMENT

- Github for version control
- Discord for team communication
- Python for the language of choice
- We used 2 different github for front-end and backend
- We used pyside6 for the GUI
- [discord.py](#) for bot framework
- ytdlp for streaming youtube links

STRUGGLES

- We had to pivot from original idea of streaming directly from your media player because it was a much bigger task then we originally thought, especially when dealing with audio from one expected codec to another
- Personal struggle was learning Python and pyqt6 for the gui as I had never used them, most of info out there was on pyqt5 so it was hard to find things that fully worked
- Wanting to implement features however most of them were quite complicated to implement leading to not a ton of app features
